

Support the design, development, testing and certification of SWIFT compliant business applications

Benefits

- ✓ Single point of access to SWIFT developer resource
- ✓ Reduced time to benefit from SWIFT integration investment
- ✓ Lower implementation and maintenance costs
- ✓ On-line sales channel

Features

- ✓ Standards power products
- ✓ Best Connectivity options for you
- ✓ Test Messaging services
- ✓ Promote your own products

Developer Resource Center

The place for developers of SWIFT compliant applications and services

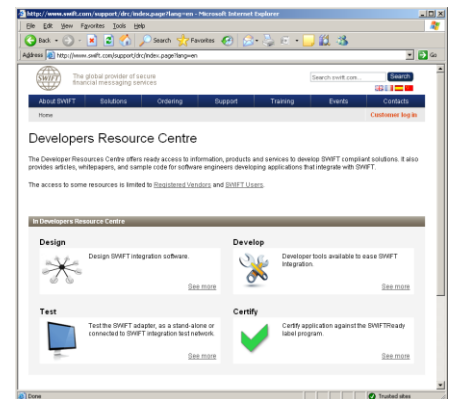

You would like to connect your application to SWIFT and you do not know where to start?
You are looking after a message transformation engine or an Alliance developer kit?
Would you like to test your financial application against SWIFT messaging services?

If one of the cases applies, then this is the right place for you.

SWIFT Developer Resource Centre aims at becoming the central point of focus for you, offering guidance, software components, tools and test cases to develop SWIFT solutions quicker, better and cheaper.

The Developer Resource Centre provides a complete and consistent framework covering the whole development cycle, spanning from architectural design, development and coding, to testing and certification against SWIFT standards, network

adapters, messaging services and business workflows.

Be it a SWIFT partner or a SWIFT user, every team developing SWIFT compliant applications follows the same journey. It all starts with the design of a business workflow for the particular domain to be supported, typically relating to payment, treasury, cash management, trade or securities. The Developer resources help you step-by-step to develop and deliver your product to the market.

Key Benefits

Single point of access to all SWIFT developer resources

Architects, designers, coders and test engineers will find a structured view of SWIFT products and services to support them throughout their development efforts, from design and coding, to test and certification. A comparison of integration options and related cost is provided to help you make the best choice for your business case and to estimate the required investment fee.

Reduced time to benefit from SWIFT integration investment

The Developer Resource Center provides a complete set of utilities, developer kits, SOA components and test cases that help reduce the efforts associated with implementing SWIFT' solutions. The use of such tools allows shortening the implementation period of a project. Consequently, you will be able to move into production quicker and achieve a much faster time-to-benefit.

Lower implementation and maintenance costs

The Developer Resource Center proposes software components from SWIFT and from partners that are qualified and follow SWIFT messaging services release policy. This reduces the implementation, testing and moving to production, thus reducing your overall maintenance costs.

On-line sales channels

Software components can be purchased and downloaded from www.swift.com. As soon as you order a product, your SWIFT profile is updated to provide you access to all available releases of the purchased products.

Key Features

The Developer Resource Center includes a rich number of products and services to support SWIFT Standards, Connectivity and Messaging Services.

Standards

The Developer Resource Center provides on-line access to the Standards Developer Kit, test messages, and test environment. The Standards Developer kit offers a coherent set of develop component, including a MX repository, MT schemas and MT/MX translation reference. It is updated and available for download with each SWIFT Standards release. SWIFT partners also developed Standards libraries to validate, transform, enrich and repair SWIFT messages. SWIFT intends to qualify these and make them available for download here as well.

Connectivity

Available SWIFT connectivity options are reviewed and compared. Various SWIFT interface packs and Alliance developer toolkits are proposed to support these connectivity options. Most of these packs include training and test environments to help you reduce your development time. The Developer Resource Center will also host the Lite AutoClient Testing Services (LATS).

Messaging Services

SWIFT provides a variety of real-time and store-and-forward messaging services covering your different needs. The Developer Resource Center proposes a set of tools and test services over the Integration Testbed to support SWIFT solutions and market initiatives in payment, trade, treasury and securities. Solutions used a combination of InterAct and FileAct messaging services.

More information

The Developer Resource Center is planned to go live by end of 2009. It will propose both SWIFT and partners products and services to accelerate your development.

You also can consider using this new channel to propose your products and services to SWIFT partners and users. In the case where you developed software components that can easily be deployed as SOA components and that add value to SWIFT messaging services or Standards, please contact us at partner.management@swift.com.

SWIFT intends to develop a program to qualify these components and to make them available to SWIFT developer community through the Developers Resource Center.
