Enabling efficient and effective screening

Guiding principles for screening ISO 20022 payments

1.1 Introduction

With the move towards faster payments there is a growing need to tackle sanctions-related friction in the payment chain

In 2020, SWIFT set out its new strategy to enable instant and frictionless transactions, anywhere in the world, supported by smart data and mutualised services. This strategy builds on the success of SWIFT gpi, which was created to address frictions that slow down transactions, adversely affect customer experience and add costs to payments processing. As the payments landscape changes to an instant 24/7 model and customer expectations grow, there is a need to further address sanctions-related friction in the payment chain.

The adoption of ISO 20022 and the CBPR+ usage guidelines supports this strategy by providing a global and open standard for information exchange. ISO 20022 is being adopted by a growing number of payment infrastructures and will become the new standard for cross-border payments starting in November 2022.

As sanctions-related friction is a growing challenge for the financial services industry, SWIFT presented a programme ('SWIFT Sanctions Screening Programme') for the community to remove sanctions friction through collective action.

One of this programme's workstreams focuses on data quality and screening practices, with the objective to design and document screening practices and supporting data quality principles for ISO 20022 messages through industry collaboration.

This document is the first deliverable of that workstream and proposes guiding principles for effective and efficient screening of ISO 20022 payments.

The granular structure of ISO 200222 creates an opportunity for the industry to re-think existing approaches to screening.

Enabling efficient and effective screening

As the payments industry prepares to adopt ISO 20022, banks are revisiting their screening environments to identify the impact of this move and opportunities for change. The ISO message provides more structured and granular information than their FIN equivalents. ISO 200222 also provides the ability to include additional information, which creates an opportunity for the industry to re-think existing approaches to screening.

Unstructured data is a barrier to building effective transaction screening and monitoring tools that mitigate sanction and AML risks. Today, using unstructured data regularly results in exception handling and significant delays in a payment's lifecycle. These delays are caused by the process of transaction due diligence (such as filtering, monitoring) or when mapping data to or from legacy formats.

On the one hand, the additional data that can be presented in ISO 20022 messages could lead to an increased number of transaction screening hits. But, contrasting this, the structure and granularity of an ISO 20022 messages allows a more targeted approach to screening financial transactions, potentially reducing the overall number of false positives and reducing associated sanctions friction.

Quality of data and structure are therefore paramount to achieving an effective and efficient implementation of transaction screening and monitoring tools. Financial institutions have an opportunity to leverage the adoption of ISO 20022 to ensure their systems and applications provide and map structured data for all parties involved in the transaction.

The guiding principles described in this document represent a 'target state', defined by the industry based upon a mature adoption of ISO 20022. Readers are invited to consider whether these principles are aligned with their institution's risk appetite, and monitor the quality of data in ISO 20022 payments when applying the principles.

1.3 Approach

The industry has collaborated to produce screening guidelines for **ISO 20022**

Enabling efficient and effective screening

Representatives from 14 global and regional banks took part in a series of workshops, analysing the pacs.008 message with the purpose of defining:

- Which ISO 20022 elements should be screened and which should not.
- How to best match these ISO 20022 elements against sanctions lists.

What data quality principles should be observed to support effective and efficient transaction screening.

The conclusions of these workshops and analysis are summarised in this document.

While the initial analysis focused exclusively on pacs.008 messages following the CBPR+ usage guidelines, the screening guidelines may be leveraged when performing similar analysis on other messages such as pacs.009 COV, pacs.004 and other messages that banks consider relevant to screen. These principles may evolve on a regular basis to cover additional messages, data elements or usage guidelines.

Observations from screening FIN messages

Over the past 5 years, SWIFT has conducted benchmouth 40 organisations, representing more than 50% of total SWIFT traffic. This captures market practices related to the way MTs are currently being screened and whice fields are most commonly screened by banks. These observations constitute a solid representation of current market practices and have informed this analysis on IS 20022 screening.

Screening practices for FIN MT 103 messages show

- Fields containing dates, amounts, charges, transaction references and codes are usually not subject to screening.
- Fields that the most banks screen include:
- Party fields (Field 50, Field 59).
 These are by far the greatest source of hits due to 1) the free format nature of the information and 2) the mismatches between data types (address information matching against names).
- Bank identification fields (Sender BIC, Rece BIC, Fields 52 to 57)

These can be a source of friction when free for names and addresses are used rather than a E

 Narrative fields: Remittance information (Field 70) and Sender to Receiver information (Field 72) also generate significant hits due the free format nature of these fields.

This insight on existing MT screening practices has informed priorities and areas of focus for ISO 20022 screening.

| | | Industry screening p | Industry screening practice | | | |
|----------------|--|----------------------|-----------------------------|--|--|--|
| Field | Field name | Field is screened | Field is not screened | | | |
| Header Block 1 | Message Sender (BIC) | 83% | 17% | | | |
| Header Block 2 | Message Receiver (BIC) | 86% | 14% | | | |
| 20 | Sender's Reference | 27% | 73% | | | |
| 13C | Time Indication | 27% | 73% | | | |
| 23B | Bank Operation Code | 30% | 70% | | | |

1.4 **Related market** guidance

This paper took into account the following market guidance:

| The Wolfsberg Group | |
|--|----------|
| Wolfsberg Group Payment | |
| Transparency Standards 2017 | 1 |
| Wolfsberg Group Sanctions | |
| Screening Guidance 2019 | 1 |
| The Payment Market Practice Group (PMPG) | |
| Structured ordering and beneficiary | |
| customer data in payments | 1 |

These guidance documents provide the foundation upon which our guiding principles are based as they:

- Describe the data elements that are expected to be included in payments.
- Describe the responsibilities of actors involved in processing payments.
- Confirm that financial institutions are expected to apply a risk-based approach to screening.
- State that financial institutions should identify which data elements within transactions are relevant for sanctions screening, and the context in which these data elements become relevant.
- Suggest that some data elements are relevant to screen whilst others may not be – though the elements that do not need to be screened can be used as supporting information to help distinguish a true match from a false match.

The principles set out in this paper take these guidance documents into account and provide a further level of detail to support an approach known as 'targeted screening'.

1.5 **Targeted screening**

Unlike the MT message syntax where all data elem (account, name, address & other) about a party are amalgamated into a single field, the ISO 20022 syn has dedicated tags for each of these data elements This structure and granularity of the information ma possible to define:

- How each data element can be used in the screening process.
 - Is the information relevant to trigger a hit against sanctions data?
 - Is the information within the data eleme considered as purely additional informa (i.e. not used to generate a match, but used by operations as supporting inform to help distinguish a true match from a false match on an alert raised on anoth part of the message) e.g. a date of birth.

| | | | | | | | If screened | d, match it aga | inst | | |

1.6 Timing of **ISO 20022 adoption**

Banks will need to continuously adapt their screening as ISO 20022 adoption matures during the co-existence period between 2022 and 2025.

Athough a number of domestic payment systems have already adopted ISO 20022 or have plans to do so in the near future, we expect the majority of financial institutions to gradually adopt ISO 20022 as their primary syntax when issuing a payment between November 2022 and November 2025. There are several dimensions in relation to ISO 20022 message formats that will need to be considered when adapting screening solutions:

Using ISO 20022 rather than MT as the syntax to issue a payment. 2

Using the structured data elements within the ISO syntax (e.g. Postal Address).

Using the new data elements that do not exist in MT (ultimate parties, structured and rich remittance information).

In terms of syntax (1), the pace of adoption will be primarily driven by the market infrastructures (MIs) in which banks participate. A number of large MIs (CHAPS, TARGET Services) plan to adopt ISO 20022 in 2022 and we expect a significant portion of payments to switch to the ISO 20022 syntax early in the co-existence period.

3

The adoption of the structured data elements within the message (2) is harder to predict. Though the use of structured data is strongly recommended from day 1 and made mandatory as from 2025 or earlier by some payment Market Infrastructures, the ability for banks and corporates to map and provide this data in a structured format involves updating many (front-end) applications.

The timing of adoption of new data elements (3) is also subject to multiple considerations: in the early phase of the co-existence period, the inclusion of such data elements could lead to increased truncation risk if the payment needs to be processed through a Market Infrastructure or an agent that is not yet ISO 20022 ready. Therefore, it is expected that in the early days of the adoption period, a so-called 'like-for-like' period will take place, and that the new data elements will progressively be adopted later during the co-existence period.

As a result, it is difficult for financial institutions to anticipate what they will receive and how the quality of the data in ISO 20022 will evolve throughout the co-existence period.

1.7 **Risk-based approach to** targeted screening

Financial institutions must adopt a riskbased approach when implementing these guiding principles.

Enabling efficient and effective screening

The targeted screening principles described in this document represent a 'target state' defined by the industry based on mature adoption and stable data quality of ISO 20022 payments.

It is therefore important that financial institutions adopt a riskbased approach when implementing these guiding principles and ensure that:

The adoption of the guiding principles is in line with the bank's risk appetite.

Banks monitor the adoption of ISO 20022, in particular the use of structured and new data elements.

Banks progressively adapt their screening to the guiding principles in line with observed ISO 20022 adoption.

Guiding principles for screening ISO 20022 payments

Guiding principles for screening ISO 20022 payments

2.1 List elements to match against

A. Individuals The lists that financial institutions load into their screening These are the sanctions records of Individuals sourced systems contain multiple types of information which influence the expected screening behaviour. As the type from public lists. These records contain: of information contained in these lists evolve, so will the guiding principles. In this section we will review the main types of information contained in the lists that are used for screening.

Most of the records contain primary attributes and unique identifiers (i.e. information that can be searched for to create a hit) and secondary attributes (i.e. information that will be used to further qualify an alert resulting from matching against primary attributes).

B. Entities

These are the sanctions records of companies or organisations sourced from public lists. These records contain:

| Primary attributesPrimary name AKA*(s) (Strong) - * Also known asUniquePassport numbers | | Primary attributes | Primary name AKA(s) (Strong) | | | |
|---|---|-----------------------|---|--|--|--|
| Unique identifiers | Passport numbers National ID numbers | Unique identifiers | Bank Identifier Code(s) / BIC(s) Legal Entity Identifiers / LEI(s) Other Identifiers (company | | | |
| Secondary attributes | AKA(s) (Weak) Addresses | | registration number, tax identification,) | | | |
| | Ownership and control (as supplied | Secondary | AKA(s) (Weak) | | | |
| | by regulators) | attributes | Addresses | | | |
| | Date of birth, place of birth Titles Sanction designation information | | Ownership and control (as sup by regulators) Sanction designation informatio | | | |

Jpplied ation

C. Vessels

Some public sanctions lists contain designations related to vessels. These records can contain:

| Primary attributes | Primary name AKA(s) (Strong) |
|-------------------------|--|
| Unique identifiers | International Maritime Organisation number (IMO) Maritime Mobile Security Identity (MMSI) |
| Secondary attributes | Vessel type Flags Ownership and control (as supplied by regulators) Sanction designation information |

D. Aircrafts

Some public sanctions lists contain designations related to aircrafts. These records can contain:

| Primary attributes | Primary name AKA*(s) (Strong) - * Also known as |
|-------------------------|---|
| Unique identifiers | Manufacturer Serial Number (MSN) |
| Secondary attributes | Aircraft model Construction number Ownership and control (as supplied by regulators) Sanction designation information |

E. BIC / LEI

BICs and LEIs are not explicitly a category of designations like the previous 4 categories above. Rather, in the context of sanctions, they are unique identifiers of sanctioned entities. Unlike other identifiers, BICs and LEIs are global in nature which make them particularly effective to identify sanctioned entities or discard potential hits.

In addition, BICs are the primary means of identification for financial institutions on the SWIFT network, where the core of international transactions is processed and contain a country code which is relevant for embargo screening. The guiding principles will therefore refer to them as a separate category.

Some regulators include BIC in their designations while others do not. Most data vendors will enrich their feed of sanctions data with BIC for financial institutions that are designated.

There are 2 methods commonly applied by the industry to screen a BIC:

- 1. Matching the BIC against list of sanctioned BICs and the BIC country code against Embargo data. This is the most effective and efficient method but requires lists that are enriched with BICs (typically by a 3rd-party vendor).
- 2. Converting the BIC into its Name and Address using a SWIFTRef product, then matching the Name and Address against sanctioned Entity and Embargo data. This method is the fallback option and provides a compensating control for when a BIC has not yet been identified, or for when the lists are not enriched with BICs but generate more false positives.

F. Embargo

The industry common practice is to use country-based screening data for countries that are subject to broad embargo restrictions, also known as comprehensive sanctions. It is not common practice to use countrybased screening data for countries where the applicable sanctions program is purely list-based.

Embargo data comprises all the information that financial institutions source to assist with country-based screening obligations.

Primary attributes

Country names ISO Country codes CTRP's (cities, towns, regions, ports, airport names)

2.2 **Business components** and data elements within transactions

Transactions contain multiple business components, which themselves contains data elements. This section covers the main types of data elements and describes whether the information contained in their tag(s) is relevant for screening or considered as additional information.

The data elements can be present in multiple places within a payment. For example, Name can appear in Debtor (Party Identification), Creditor (Party Identification) but equally in Debtor Agent (Financial Institution Identification), etc. We will therefore provide guiding principles for the data elements that are most relevant for screening.

In most cases, the guiding principles will apply wherever the data element appears in a transaction. In some cases however, the business components in which they are present will influence the screening principle.

In line with the Wolfsberg guidance on sanctions screening, business components such as amounts, dates and transaction reference numbers have no relevance from a screening perspective and will therefore not be explicitly covered. Financial institutions need to ensure, however, that this is line with their risk-appetite.

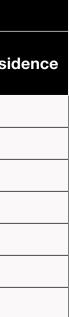

| | | Data Element | | | | |
|----------|--------------------------------------|--------------|----------------|----------------|-----------------------------|------------------|
| | | Name | Postal Address | Identification | Unstructured Information | Country of Resid |
| | Party Identification | X | Х | Х | | Х |

2.4 Guiding principles for data elements

Guiding principles for screening ISO 20022 payments

The following section provides the details of the targeted screening approach supported by the industry for ISO 20022 messages. This publication seeks to document the market practices for screening ISO 20022 messages. It was created in consultation and based on the feedback of a group of SWIFT customers representing a large portion of SWIFT's traffic. As a mere informative publication, it is not designed to provide any recommendation or advice to the recipient, and should not be used as such. The guiding principles assume that the recipient is familiar with the ISO 20022 message syntax for a pacs.008. Supporting information can be found on SWIFT's website:

Downloads

ISO 20022 for dummies

ISO 20022 CBPR+ user handbook

MyStandards

Α. Name <Nm>

In most cases, the Name tag refers to the name by which a party or agent is known, which is usually used to identify that party or agent. It is therefore expected that financial institutions will screen this tag.

Data quality principles

The Name tag should not contain other elements th name. BIC and other identifiers must be included in respective fields.

For natural person customers (aka Individuals), the recorded in the financial institution's systems should the full name of the customer that was verified as pa Customer Due Diligence (CDD).

For legal entity customers, the financial institution should place preference on the registered legal entity name verified as part of CDD.

For names of beneficiary party(ies), financial institutions should include the name of the beneficiary as provided by the originator of the transaction.

| | | | | | If screened, match it against | | | | | | |
|--------|---------------|------|-------------|-----------------|-------------------------------|----------|---------|-----------|-----------|---------|------------|
| Name | XML Tag | Mult | Type / Code | Screen (YES/NO) | Individuals | Entities | Vessels | Aircrafts | BIC / LEI | Embargo | Match Type |

l institutions indicate they may screen ainst Embargo data to detect a possible ith sanctioned countries in the Name itself

Β. **Postal Address**

The Postal Address is the information that locates and identifies a specific address, as defined by postal services. The Postal Address data element contains multiple tags which can be used for:

- Structured address details. In such case the components of the address will be included in their respective tags.
- Unstructured address details. In this case all the information will be included in a single tag which can be repeated as required to include all information.

Note that, according to the CBPR+ usage guidelines, the unstructured and structured address tags are mutually exclusive. Furthermore, it is expected that the unstructured address tags will be decommissioned in 2025.

Structured Postal Address

Data quality principles

The structured Postal Address option is preferred.

Financial institutions are expected to include information according to the resident country convention. At a minimum, Town Name and Country must be present. Post Code is recommended.

| | | | | | | | If screene | d, match it aga | inst | | |

Table 7

Screening structured Postal Address

Guiding principle for screening

When using the structured Postal Address tag, the following tags should be screened if present: Town Name, Town Location Name, District Name, Country Sub Division, Country. These elements will be matched against Embargo data (Table 7).

Risk Appetite

Some financial institutions indicate they may screen Department and Sub Department tags against Embargo data to identify a possible connection with sanctioned countries (Table 7).

Some financial institutions indicate they may screen Post Code tags against Embargo data to detect a possible connection with sanction programmes when the programme targets a specific region, not a country (Table 7).

Unstructured Postal Address

Data quality principles

Financial institutions are expected to include information
according to the resident country convention. At a
minimum, Town Name and Country must be present.When using the unstructured Postal Address tag, the
entire tag should be screened against embargo data.Post Code is recommended.If the tag is repeated (up to 3 lines), the information should
be concatenated to be screened to avoid risks that
information split over 2 lines causes the filter to miss it
(Table 8).

| Address line | <adrline></adrline> | [03] | text{1,35} | YES | RA | RA | | | | YES | FUZZY |

Table 8Screening unstructured Postal Address

Guiding principle for screening

Risk Appetite

Some financial institutions indicate they may screen Address Line against Individuals and Entities to cater for cases where MT/MX translation tools are used, as there is a possibility that the name information in field 50 carries over to the second line, and in such case it could end-up in the Address Line (Table 8).

/pe

C. Identification

Identification provides unique and unambiguous identification of a party. The data element provides the ability to identify:

An organization - using the Identification/
Organisation tag(s).
An individual - using the Identification/Private Identification tag(s).

Organisation identification

Data quality principles

In case the party is an organisation, the use of a BIC in the Organisation ID/AnyBIC tag in combination with an Account Number or Organisation ID/Other can serve as the primary source of identification for the party and replace the Name and Postal Address. Structured identifiers are more efficient for screening purposes than free text names and addresses (Table 9).

| | | | | | | | If screened | match it aga | inst | | |

 Table 9

 Screening Organisation Identification

Guiding principle for screening

When using the Organisation Identification, the following tags should be screened if present:

- Any BIC will be screened against lists of sanctioned BICs and Embargo data related to countries (using the 5th and 6th characters of the BIC) (Table 9).
- LEI will be screened against list of sanctioned LEIs (if any). If geographical information can be inferred from the LEI, it should be screened against Embargo data (Table 9).
- Other Identification should be screened against relevant identifiers of sanctioned Entities (Table 9).
- The Issuing Organisation of the Other Identification should be screened against sanctioned Entities (Table 9).

Risk appetite

Some financial institutions may screen BIC and LEI against sanctioned Entities after expanding the identifiers into full name and address if their lists are not enriched with BICs and LEIs (Table 9).

Some financial institutions indicate they may screen Other Identification against sanctioned Individuals to identify potential ownership and control linkages (Table 9). Some financial institutions indicate they may screen Issuer against Embargo data to identify a possible connection with sanctioned countries (Table 9).

Private Identification

Data quality principles

In case the party is an Individual, the use of Private Identification in addition to Name and Postal Address is recommended if Account Number is not included. Inclusion of additional identifiers are likely to facilitate the alert disposition process (Table 10).

| | | | | | | | If screene | d, match it aga | ainst | | |

Table 10 Screening Private Identification

Guiding Principle for screening

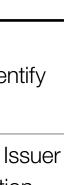

When using the Private Identification, the following tags should be screened if present:

- Other Identification should be screened against relevant identifiers of sanctioned Individuals (Table 10).
- The Issuing Organisation of the Other Identification should be screened against sanctioned Entities (Table 10).

Risk appetite

Some financial institutions indicate they may screen Other Identification against sanctioned Entities to identify potential ownership and control linkages (Table 10).

Some financial institutions indicate they may screen Issuer against Embargo data to identify a possible connection with sanctioned countries (Table 10).

D. Country of residence

Country in which a person resides (the place of a person's home). In the case of a company, it is the country from which the affairs of that company are directed.

Data quality principles

Country of Residence (where the party physically lives) When used, Country of Residence should be screened against Embargo data (Table 11). Country (country linked to the owner of the account used for contact purposes).

| | | | | | | | If screened, | match it agai | nst | | |
|----------------------|-------------------------|------|-----------------|-----------------|-------------|----------|--------------|---------------|------------------|---------|-----------|

Guiding principle for screening

23

Ε. **Unstructured information**

Free format information tags are present in a number of business components such as the Remittance Information, Instruction for Next Agent, Instruction for Creditor Agent, Regulatory reporting, etc.

The Remittance Information business component provides 2 options that are mutually exclusive:

- Unstructured remittance information: Information supplied to enable the matching/reconciliation of an entry with the items that the payment is intended to settle, such as commercial invoices in an accounts' receivable system, in an unstructured form.
- Structured remittance information: same as above in a structured form. Note that the structured remittance information field contains multiple tags, some of which are unstructured.

Guiding principle for screening

When present, unstructured information tags should be screened against all list elements (Table 12).
